ABSTRACT: The author, a former Komsomol member, graduated as an instructor in aviation and was assigned to the Moskovskaya oblastnaya planernaya shkola (Moscow Oblast Gliding School). She resumed training at the Vysshaya letno-planernaya shkola (Higher Aviation Gliding School) at Koktebel' and participated in All-Union glider competitions, establishing a world record in gliding in October 1935. Assigned to the Tsentral'nyy aeroklub imeni V.P. Chkalova (Central Aeroclub imeni V.P. Chkalov) she organized a group of women pilots which she led during air parades. A Communist Party member, she was the first woman to be awarded the title of Honorary Master of Sports. She is president of the DOSAAF All-Union Glider Section and a member of the Presidium of the DOSAAF Central Committee. There is 1 photograph of the author.

Ratser-Ivanova, F. S. - Semi-diurnal tides in a two-dimensional infinite channel of constant depth rotating with constant angular velocity. Bull. Acad. Sci. URSS, Ser. Geograph. Geophys. [Izvestia Akad. Nauk SSSR] 10, 373-382 (1946). (Russian. English summary)

The equation for semi-diurnal tides in two-dimensional basins is solved with the aid of conformal mapping of the contour confining the basin upon the upper half-plane. The problem is solved for the case of an infinite channel of constant depth rotating with constant angular velocity. The solution is given for a special form of the boundary condition. The following suppositions on tidal waves are made: we consider long waves and neglect vertical accelerations; the amplitude of the oscillations of the liquid's particles is regarded as small compared with the depth of the channel. The solution is obtained as a series by the small parameter method.

TITLE: Determination of the Tidal Periods of the Diurnal and Half-Diurnal Types of Free Oscillations in the Polar Basins
(Opredeleniye periodov svobodnykh kolebaniy sutochnogo i polusutochnogo tipov v polyarnykh moryakh)

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geofizicheskaya, 1959, Nr 2, pp 254-261 (USSR)

ABSTRACT: The determination of the tidal oscillations for Polar basins (Polar "cap") encircled by the latitudes is described in this work. The basic equation, Eq (1) is given, where a - radius of the Earth (mean), ω - angular velocity of the Earth's rotation, ζ - increase of the height of the water above the equilibrium, θ - complement of the latitude ($\theta = 90^\circ - \phi$), h - thickness of the water layer, g - gravitational force, s - type of the waves (1 - diurnal, 2 - 1/2 diurnal), $f = \sigma/2\omega$ - a parameter proportional to the frequency or velocity of the wave σ . The above equation becomes Eq (2) for $h = \text{const}$. This equation can be expressed as Eq (3)(4) when $\mu = 1$, and $\gamma = A$ (Ref 1). The formula (3) defines the

Card 1/5

SOV/49-59-2-10/25

Determination of the Tidal Periods of the Diurnal and Half-Diurnal Types of Free Oscillations in the Polar Basins

form of the water surface. When the sea is represented as a Polar "cap" encircled by the latitude $\theta = Q_c (u = u_o)$, then the respective components of the velocity of the particles of water in the directions of the Equator and the Polar circle (u and v) will be expressed as Eq (5) and the limiting condition $u/u_o = 0$ will be expressed as Eq (6), which

can also be written as Eq (7) or Eq (8) when the Bessel functions (Ref 2) are applied. Thus, Eqs (8) and (I) determine the frequency of the tidal oscillations. In order to determine the period of the diurnal oscillations, the Eq (8) can be transformed into Eq (8₁), where s is taken as 1.

Similarly, the Eq (I) becomes (I₁) when

$$\beta_{s-1} = \beta - \frac{1}{f(f+1)}$$

For the oscillations of the half-diurnal type the Eqs (8₂) and Card 2/5 (I₂) are found accordingly. The computation of the periods

SOV/49-59-2-10/25

Determination of the Tidal Periods of the Diurnal and Half-Diurnal Types of Free Oscillations in the Polar Basins

for various depths and dimensions of the sea can be made simple when Eqs (8₁) and (I₁) (for diurnal type) are represented in the form of Eq (9). As an example a computation was performed for $G' = 5; 10; 15; \dots 85^\circ$ and $\varphi_o = 10; 20; \dots 80;$ 85° . The values of t for various f were found from the trigonometric and elliptic interval tables (Ref 3) while the intersection points of the curves $Y(t)$ and $G(f)$ (bottom of p 257) were found when $Y(t)$ was considered as a function of f , i.e. $Y(t) = Y[t(f)]$. Table 1 shows the periods of diurnal-type oscillations for the sea encircled by $\varphi_o = 60^\circ$ and the depths 8850, 4430, 2210, 1600, 1250, 1000 and 800 m, which represent $\beta = 10, 20, 40, 49, 64, 81, 100$ (the first column indicates the 7 oscillations). Similar tables were made for $\varphi_c = 30^\circ$ (Table 2) and for φ_c varying from 85 to 20° and one depth only, 2210 m (Table 3). The comparison was made between the results thus calculated and those obtained

Card 3/5

SOV/49-59-2-10/25

Determination of the Tidal Periods of the Diurnal and Half-Diurnal Types of Free Oscillations in the Polar Basins

by Goldsborough (Ref 4), showing a close similarity. The Table at the bottom of p 258 gives some of the data from both methods for the depths $\beta = 10, 20$ and 40 . Fig 1 shows the relation of the diurnal periods and β , i.e. the depth h for $\varphi_0 = 60^\circ$ ($1, 2, 3, \dots 7$ - 7 oscillations), Fig 2 - as Fig 1 for $\varphi_0 = 30^\circ$, Fig 3 - relation of the diurnal period and the area of the sea ($\beta = 40$). Similar data (Tables 4 and 5, Figs 4 and 5) were found for the half-diurnal oscillations. These results show that the period increases with a decrease of depth and with an increase of the sea area. Also, the half-diurnal type of oscillations becomes negligible near the Poles, which can be actually observed, while its period becomes almost equal to 12 hours in the sea at $\varphi_0 = 30^\circ$.

(Bulletin of the Ac.Sc., Geophysics Series), 1957, No.3,
pp.369-383 (U.S.S.R.)

ABSTRACT: Oscillations with periods of less than twelve hours were
investigated by the author in an earlier paper (same
journal, 1956, No.1). The basic differential equations
considered in that paper have singular points only at the
poles; the basic differential equations given in this
paper have singular points not only at the poles but also
at "critical" latitudes, which are symmetrical in both
hemispheres. In the same way as in the earlier paper, the
problem is solved by the method of asymptotic expansion of
the solutions of the differential equations. The here
presented method is intended for calculating the periods of
free tidal type oscillations for a layer of liquid of
constant depth on the revolving Earth. The case of
oscillations with periods exceeding twelve hours and below

Card 1/2

twenty-four hours is considered. The derived formulae give values which approach closely values obtained by exact formulae and enable large scale calculation of oscillation periods for various depths. Acknowledgment is made to L. N. Sretenskiy.

(Avtomaticheskaya zazhimnaya korobka propuskov)

PERIODICAL: Metallurg, 1958, Nr 6, pp 25 - 27 (USSR)

ABSTRACT: The works are supplying spring steel strip with parabolic edges made of the steel 50KhGA to the Gor'kovskiy avtozavod (Gor'kiy Motor Works). For a long time, a large quantity of material had to be scrapped due to whiskers at the strip edge resulting from the use of a manually operated clamping frames in the sizing rolls. In the case of manual clamping, the operator could not close the roll-pass simultaneously with feeding the material into the sizing rolls and, as a result of this, whiskers were produced on the edge of each strip for a length of 4 to 5 mm. In this paper, an original design is described of an automatic clamping device of roll-passes, the installation of which enabled liquidating fully the rejects due to this fault. A sketch of the system is shown in Figure 1.

Card 1/3

SOV/130-58-6-11/20

Automatic Clamping Frame for Blanks During Rolling

Figure 2 shows the automatic equipment for generating a current impulse for actuating the electromagnetic coil. The sketch, Figure 4, shows the design of the system which produces the clamping force. The whole system is based on utilizing the elastic deformation of the rolls during feeding-in of the blank to push upwards the textolite end of a contact-closing rod. This results in the closing of an electric circuit which, in turn, actuates the clamping device. To reduce danger to the operating personnel, the operating voltage in the circuit of the regulator is 36 V. A rolling stand, fitted with such an automatic clamping device, has so far been operating satisfactorily for two years.

SUBJECT USSR / PHYSICS CARD 1 / 2 PA - 1995
AUTHOR LETOV, A.M., NAUMOV, B.N., RACEEV, V.A., CYPKIN, J.A.Z.
TITLE The Congress on Automatic Control Held at Heidelberg (German
Federal Republic).
PERIODICAL Avtomatika i telemekhanika 18, fasc.1, 93-96 (1957)
Issued: 2 / 1957

This congress took place from the 25.9.1956 to the 29.9.1956 at Heidelberg and was organized by the department for control techniques (president Dr.Grebe) of the Society of German Electrotechnic/Engineering (VDE/VDI). The congress was attended by scientists of international repute. Most of the participants, practitioners and theoreticians came from Western Germany. The USSR was represented by a delegation of the Institute for Automatics and Telemechanics of the Academy of Science in the USSR under the leadership of A.M.LETOV. The Soviet delegation had the following instructions: a) to take part in the congress, b) to establish contact with foreign scientists taking part in the congress as well as with technical engineering circles, c) to visit several firms. Soviet cooperation in the congress consisted in: a) lectures held by Soviet delegates, answering as well as asking questions in the course of discussions, b) participation in discussions concerning lectures delivered by delegates of other countries.

Organisation and work performed by the congress are both described as being good. The texts of the total of about 70 original lectures were submitted to the organizing committee already before the congress was opened; they were

Avtomatika i telemechanika 18, fasc. 1, 93-96 (1957) CARD 2 / 2 PA - 1995
printed 6 - 8 weeks in advance and were sent to all participants. This made it possible to study all details closely up to the control of computations and calculations, which made discussions particularly interesting. After the congress was opened plenary lectures were delivered: The following 11 departments were organized: 1.) Technical means of automatics, 2.) reciprocally coupled control, 3.) linear methods in the theory of control, 4.) the automatized factory, 5.) determination of nonlinear processes by means of frequency methods, 6.) nonlinear and interrupted control systems, 7.) the control of boilers, 8.) optimum tuning and quality of control, 9.) control in industry, 10.) statistical methods of control, 11.) computers (counting machines) in control technics. Among others the following problems were discussed: The application of nonlinear elements and computing devices on control systems, the determination of the dynamic characteristics of objects from the data obtained on the basis of normal work. The themes of some works are mentioned.
The following aims were formulated for the organization of an International Federation of Specialists on Automatic Control: 1.) Exchange of information concerning the automatic control among individual member states, 2.) Organization of international congresses on automatic control every four years.
A committee which was charged with the task of preparing the organization of this federation was formed.

TITLE: Distribution of radioactive colloidal Au 198 and histological changes in the tissues following its introduction into the abdominal cavity

SOURCE: Meditsinskaya radiologiya, v. 10, no. 4, 1965, 49-53, and insert facing

TOPIC TAGS: gold, abdomen, radiation injury, tumor, radioactive isotope, histology

ABSTRACT: Autopsy data from 17 patients who had died of various complications shortly after radical surgery and intra-abdominal administration of Au 198, changes revealed by gross inspection of the abdominal cavity of 11 persons reoperated for complications, and experiments on rabbits indicated that most of the Au 198 so administered settles upon the various organs within the abdominal cavity and remains there. Only insignificant amounts of the isotope spread beyond the abdominal cavity. Accordingly, degenerative changes and consequent proliferation of connective tissue were found to be most pronounced in the peritoneum in the tissues and

Card 1/2

L-53970-65

ACCESSION NR: AP5011233

organs where the isotope had concentrated. There were no radiation effects on tumor cells in the lymph nodes with large metastases. It follows from the distribution of Au 198 and histological study of various tissues that the radiation effects of the isotope are manifested only on surface elements of the tumor. The adhesions that develop in the abdominal cavity may be the cause of the subsequent pain felt by the patients (obstruction) and may complicate repeated surgical intervention. Orig. art. has: 2 figures and 2 tables.

ORG: Hydrometeorological Scientific Research Center, SSSR (Gidrometeorologicheskiy nauchno-issledovatel'skiy tsentr SSSR)

TITLE: A method of computing transparency and visual range of lights on a slant line

SOURCE: Meteorologiya i gidrologiya, no. 1, 1967, 28-33

TOPIC TAGS: atmospheric visibility, atmospheric transparency, meteorologic observation

ABSTRACT: There is no present means of measuring slant visibility directly, but it now appears possible to use horizontal meteorological visibility at different levels to determine the value indirectly. The author has considered the theoretical statement of such a value and has plotted measured horizontal visibilities versus height for various conditions (smoke, frost, small snow particles, high relative humidity) beneath clouds at heights of 150 m and less. From the plotted points he has obtained an empirical formula to define the curve representing nearest fit. The formula is:

$$S(h) = \frac{2S_n + 0.28S_0}{H^2} h^2 - \frac{S_n + 1.28S_0}{H} h + S_0$$

Card 1/2

UDC: 551.591.6

ACC NR: AP7006321

where S is the visibility (S_0 is horizontal visibility at the earth's surface, S_H is horizontal visibility at the lower boundary of the cloud), H is height of the lower boundary of the cloud, and h is the height of slant visibility. Computations of slant visibility show that the transparency of the atmosphere beneath a cloud cover changes from horizontal view to slant view. As the angle of view (measured from the horizontal) increases, and as the horizontal visibility at the earth's surface increases, the ratio of slant visibility to horizontal visibility increases. It is noted that the horizontal values used in plotting were obtained from night observations. If the formula above is to be used for daylight computation, modifications are needed. Orig. art. has: 1 figure, 2 tables, and 24 formulas.

The state of cholesterol and phospholipides in the brains of animals. S. V. Nedzvetskil and B. S. Ratsitskayn. (Sanit.-Ityg. Med. Inst., Leningrad). Biokhimiya 19, 677-82 (1951).—Blood vessels and dura of cattle brains were removed. Tissues were ground with glass in 0.9% NaCl and centrifuged. The supernatant was designated as ext. 1 and the sediment subjected to a second similar extn. and centrifugation. The second supernatant was designated as ext. 2. The sediment was then extd. twice with 7% NaCl and residue ground in 0.25% NaOH. Tests thus obtained which gave the bluet reaction were tested for content of cholesterol and phospholipides. Tests were also made to det. whether the cholesterol and phospholipides are in combination with the proteins of the brain tissues. It was shown that by the NaCl solvents 24-27% of the cholesterol is extd. from the gray matter of the brain, 6-8% from the white matter, and 11-19% from the cerebellum. In these extns. the cholesterol is in combination with the brain proteins. By the same processes 33-45% of the phospholipides are extd. from the gray matter, 27-33% from the white matter, and 36-45% from the cerebellum. About 50% of the phospholipides thus extd. are not in union wth the proteins, or united in only a weak manner. The 0.25% aq. soln. of NaOH exts. the remainder of the cholesterol and phospholipides which are in combination with the brain tissue proteins. These are easily split. by HCl and again redissolved by NaOH without any change in their original complex structure. N. S. Levine.

Secretary: I.I. Sushkov, Tech. Secy. V.V. Volkova.

Abstract. The publication is intended for geologists and geophysicists, particularly for those interested in the study of seismic waves and their use in geological prospecting.

CONTENTS. This is a collective of 17 articles, published by the Academy of Sciences USSR as transactions of the Institute of Physics of the Earth. The first four articles present mainly an analysis of impulsive properties of waves. The second group of four articles deals with problems of frequency analysis of seismic waves. The remaining articles cover a wide field of problems in seismology such as methods of interpretation of dynamic properties of waves, determination of reflected longitudinal waves, design of high-frequency seismometers, etc. References are given at the end of each article. Topic terms, e.g., some results of the analysis of formulas for the amplitude of reflected waves

AUTHORS: Ratsun, M.O. and Kunin, V.Ya.

TITLE: Determination of the Pressure of Residual Gases in Electron Tubes (Opredeleniye davleniya ostatochnogo gaza v elektronnykh lampakh)

PERIODICAL: Radiotekhnika i Elektronika, 1958, Vol.III, No.3,
pp. 435 - 437 (USSR).

ABSTRACT: The investigation was carried out by the method proposed by Herold (Refs. 1 and 2). Several types of Soviet-made tubes were measured. The first and the second grids or the anode of the tubes were used as the ion catchers, while the electrons were collected by either the anode or the second grid. It was found that in the tube type 5U-30, pressures during the various stages of the manufacture and processing were in the range of 7.5×10^{-6} to 2.2×10^{-8} mmHg; for the tube type 6~~11~~10, the pressures were in the range 1.2×10^{-4} to 2×10^{-6} mmHg. Tubes, type 6~~11~~C were measured more thoroughly; graphs of the residual gas pressure, as a function of the operating time of the tubes, are shown in Fig.2; Curve 3 represents the pressure in a normal tube, while Curves 1 and 2 relate to tubes having an increased pressure. Also, the mutual conductance S in mA/V and the anode current, as functions of the operating time,

TITLE: On the Ventilation of Transformer Chambers (K voprosu
o ventilyatsii transformatornykh kamer)

PERIODICAL: Promyshlennaya Energetika, 1958, Nr 12, pp 12-14 (USSR)

ABSTRACT: Under this heading there are three separate short
articles discussing the article by Shnitser, Zotov and
Khesin published in Promyshlennaya Energetika, 1957, Nr 12.

Grodskiy, S.Ye., pp 12-13

This author considers that the original article
correctly states that it is not necessary to provide
ventilation shafts in closed transformer chambers for
outputs up to 1 MVA. The author's institute is designing
transformer chambers of this kind. However, various
objections are raised to the ventilation arrangements
proposed by the authors. The air resistance formulae
that they give are not accurate. The recommended
ventilation arrangements are not satisfactory. The

Card 1/3

SOV/94-58-12-5/19

On the Ventilation of Transformer Chambers

practical experience of transformer cooling noted in the article is not sufficient. The latest design of transformer chamber used by the author's organisation overcomes these defects and is briefly described with reference to the sketch. Air reaches the transformer from one side and from underneath and leaves near the top. This method of construction has been successful in practice.

ASSOCIATION: Giprotraktorosel'khozmash

Kudryashov, S.A., p 13

This author states that the original authors should not have used the maximum permissible outlet air temperature at 45°C but should have used a mean temperature of 40°C. Therefore, the table of ventilating duct areas gives values that are too low.

SOV/94-58-12-5/19

On the Ventilation of Transformer Chambers

Lifshits, V.L., and Rattel' K.N., p 14

Operating experience with transformer substations in textile factories in Central Asia which are fully loaded all day shows that the recommended method of ventilation is not adequate in this case. In such circumstances, the use of ventilating shafts has been found very effective. In the test results described in the original article insufficient reference is made to climatic conditions. The authors' organisation has to use more generous ventilation arrangements than are recommended in the article.

AUTHOR:

Ratti, G. V., Engineer (Moscow)

TITLE:

"On the Permissible Span of Overhead Pipelines"
(O dopustimykh proletakh truboprovodov pri nadzemnoy prokladke).

PERIODICAL: Stroitel'stvo Predpriyatiy Neftyanoy Promyshlennosti, 1957, Nr 11,
pp. 17 - 17 (USSR).

ABSTRACT: This is a criticism of an article published by M. N. Ruchimskiy, candidate of technical sciences. What he says about the possibility of the increasing bending stress up to 1100 kg / cm², without impairing the durability of the pipeline without doubt holds good for most pipelines. It must, however, be mentioned that in the case of thin-walled pipelines with the diameter of more than 1,5 - 2 m the problem concerning the possibility of increasing stresses at present permitted must, in addition, be discussed. There follow some details and formulae for calculation. A formula was computed as a result of experiments carried out with cylindrical sections of the pipeline, which was used under conditions that were different from a pipeline resting upon one, two, or several supports. It is therefore necessary, additionally to investigate the problem of permitted stress limits when calculating thin-walled pipelines of large diameter.
